

Selective Alpha-2 Blockers

Selective α_2 blockers are a class of drug which includes mirtazapine. This medication is indicated for depression treatment, though it has many off-label uses. It works by selectively blocking α_2 receptors, and having antagonist activity at 5-HT receptors, as well as other receptors. Mirtazapine has the side effects of sedation and increased serum cholesterol. A majority of patients develop weight gain while taking this drug as well.

This drug is generally defined as a selective α_2 adrenergic receptor antagonist.

Side Effects

Sedation

[Sedation-dart](#)

Sedation is a common side effect that may occur, possibly due to the blockade of 5-HT₂ and 5-HT₃ receptors.

Weight gain
