

Lung Sounds - Rhonchi

Rhonchi develops due to airway obstruction, increased secretions, and bronchospasms. Rhonchi can be auscultated near the trachea and bronchi and sound like a low pitched rumbling and gurgling sound.

PLAY PICMONIC

Location

Trachea and Bronchi

[Trachea and Broccoli](#)

Rhonchi can be auscultated over the trachea and bronchi and are more prominent during exhalation than inhalation. They are often heard in patients with chronic bronchitis and typically clear after coughing or suctioning.

Description

Low Pitched Rumbling

[Low Pitched bass-drum](#)

Rhonchi lung sounds are a low pitched rumbling or snoring sound that occurs due to obstruction of the large airways.

Sounds Like

Gurgling

[Gurgling-gargoyle](#)

Rhonchi may sound like a gurgling or rattling sound prominent near the trachea and bronchi that is loudest during expiration than inhalation.

Cause

Narrowed Airway

[Narrowed Airway](#)

Rhonchi are caused by airway obstructions most often resulting from increased secretions. Narrowed airways can develop as a result of COPD, cystic fibrosis, and pneumonia.

Secretions or Bronchospasm

[Secretions and Broccoli-spaceship](#)

Secretions and bronchospasms can cause a narrowing of the airways resulting in the development of low pitched rumbling and gurgling sounds.
