

Edwards Syndrome

Edwards syndrome is also known as trisomy 18, as this typically results from nondisjunction of chromosome 18, leading to three chromosomal copies. Patients display intellectual disability, along with rocker bottom feet. VSD is associated with Edwards syndrome, and children with this disorder display clenched hands with overlapping fingers. Facial features include low set ears, micrognathia and a prominent occiput. GI abnormalities associated with this syndrome include omphalocele and Meckel's diverticulum. Commonly, patients have a horseshoe kidney, and can develop malrotation of the gut.

PLAY PICMONIC

Pathophysiology

Trisomy 18

[Tricycle \(18\) ID at Voting booth](#)

Edwards syndrome is caused by the presence of a complete or partial extra copy of chromosome 18.

Signs and Symptoms

Intellectual Disability (Mental Retardation)

[Tar Covered Book](#)

Children with Edwards syndrome display significantly impaired cognitive functioning and deficits in two or more adaptive behaviors.

Rocker Bottom Feet

[Rocking-chair with Rocker Bottom Feet](#)

Rocker bottom feet are characterized by a prominent calcaneus and a rounded bottom of the foot, resembling the bottom of a rocking chair.

Ventricular Septal Defect (VSD)

[V-ventricle Scepter heart defect](#)

Ventricular septal defect is a congenital heart defect that enables blood to flow between the left and right ventricle. VSDs are common in children with Edwards syndrome. Other congenital heart defects may occur like PDA, ASD, and ToF. However, VSD is most common.

Clenched Hands

[Clenched fist](#)

Persistently flexed finger joints are a common physical finding in Edwards syndrome.

Overlapping Fingers

[Overlapping Fingers](#)

Patients with Edwards syndrome often exhibit overlapping fingers. Hands can present with overlapping digits, in which the second and fifth fingers sit atop the third and fourth fingers, respectively.

Low-Set Ears

[Low set ears](#)

Low-set ears are a common physical finding in Edwards syndrome.

Micrognathia

[Small-jaw with Micro-gnats](#)

Micrognathia is a small jaw, which is a common physical finding in Edwards syndrome.

Prominent Occiput

[Prominent Octopus](#)

An enlarged protruding occiput is a common physical finding in Edwards syndrome.

Omphalocele

[O-full-of-eels](#)

Omphalocele is associated with Edwards syndrome. This is an abdominal wall defect leading to the intestines, liver and sometimes other organs extruding out of the abdomen, while being contained in a peritoneal sac. This occurs at the midline and the outpouching occurs at the navel.

Meckel's Diverticulum

[Meckel-mouse Diver](#)

Meckel's diverticulum is a common gastrointestinal defect associated with Edwards syndrome. This is a vestigial remnant of the vitelline duct, and is described as a slight bulge in the small intestine.

Horseshoe Kidney

[Horseshoe Kidneys](#)

Up to 20% of patients with Edwards syndrome have genitourinal defects, such as horseshoe kidney. Other defects include hydronephrosis and cystic kidneys.

Malrotation of Intestines

[Mallet-rotating Intestines](#)

Malrotation of the intestine is a congenital anatomical anomaly that results from an abnormal rotation of the gut as it returns to the abdominal cavity during embryogenesis. Occurance of this anomaly is believed to be due to hereditary factors, or an underlying genetic disorder, such as Edwards syndrome.
