

## Cri Du Chat

Cri Du Chat is the result of a congenital partial deletion that most commonly occurs de novo. Like most other microdeletions, this one causes a syndrome.

### Pathophysiology

#### Congenital Deletion of Short Arm of Chromosome 5p

##### [Cutting off Chromosome of \(5\) Hand on Short Arm](#)

Cri Du Chat occurs as a result of a *de novo* partial deletion of Chromosome 5p. As such, it is classified as one of the “5p- syndromes”.

### Signs and Symptoms

#### High Pitched Cry/Mewing

##### [High Pitched Crying Meow](#)

A hallmark of Cri Du Chat is a high-pitched cry due to an underdeveloped, dysmorphic larynx. The high-pitched cry usually resolves by age 2.

#### Microcephaly

##### [Small-head](#)

Microcephaly, or a shrunken head, is the most prominent clinical feature of Cri Du Chat syndrome. Research has shown a strong genotype-phenotype correlation between the degree of severity of the microcephaly and the amount of partial deletion that occurs in 5p.

#### Hypotonia

##### [Floppy Hippo-baby](#)

Patients with Cri Du Chat will present with hypotonia, failure to thrive, and developmental delay.

#### Difficulty Sucking and Swallowing

##### [Difficulty Sucking](#)

Due to microcephaly and psychomotor retardation, patients with Cri Du Chat have difficulty with sucking and swallowing.

#### Epicanthal Folds

##### [Epicanthal Folds](#)

Epicanthal folds occur when the skin of the upper eyelid covers the inner corners of the eyes, a common feature seen in Cri Du Chat.

#### Widely Spaced Eyes

##### [Wide Spaced Eyes](#)

Patients typically have orbital hypertelorism, resulting in an abnormally wide space in between the patient’s eyes.

#### Wide & Flat Nasal Bridge

##### [Wide & Flat Nasal Bridge](#)

Another common feature in patients with Cri Du Chat is a wide and flat nasal bridge.

**High Arched Palate**[High Arched Palette](#)

A high-arched palate is a variable feature in patients with Cri Du Chat. The palate is narrow and high.

**Intellectual Disability**[Tar Covered Book](#)

The severity of the intellectual disability is dependent on the size of the deletion.

**Cardiac Abnormalities**[Abnormal Heart](#)

Congenital heart defects (most commonly VSD), pneumonia, and respiratory distress syndrome are the most common causes of death in patients with Cri Du Chat.
